TOO MANY FILES ARGH-

So, I added some new file formats. Here’s what to download, and how to open them !

1) The HTML file (in a zip folder)

   It’s pretty, because no page breaks, nor a useless grid. It’s fast, and opens on any browser. It’s my favorite. You’ll need to unzip it (with 7-Zip, or something), try and google that if you don’t know anything about zip folders.

2) The PDF file

   Page breaks, nooo. It’s fast to open. It can open in most browsers, or in adobe acrobat DC.

3) The excel file

   Takes a little time to open, but you can modify it if you want. It opens in excel, or LibreOffice Calc.

4) The mht file

   Same as the excel file, but no modification, but fast ! It may want to open it in the browser; it won’t work.

5) The xps file

   Same as the PDF file, but different, I guess ? I dunno why I put this here. You can open it with the XPS viewer in windows.
